

Student Essay Evaluation: 19/30

November 16, 2023

The workshop course is provided by technology-oriented engineering department. The goal is to understand technologies but also to foster motivation and active involvement of groupwork. The assignment given to the students was as follows:

1. Kinematic Synthesis of Mechanisms <Train Gap Filler>

The gap between the train and the platform at train stations is a significant safety hazard, often leading to accidents. This risk is especially high for children, the elderly, and individuals with physical disabilities with wheelchairs. The challenge is to devise a mechanism that effectively mitigates this danger.

2. Kinematic Synthesis of Mechanisms <Say “NO” to Door Knobs>

This project develops a new mechanism for touchless doors, inspired by the widespread unease with touching door handles in public spaces like schools, hospitals, and restrooms during the Covid-19 pandemic. This design aims to eliminate the need for physical contact with door knobs.

3. Net Zero X <Carbon Dioxide Removal>

Given that emissions of CO₂ are produced by all sectors of society, identifying effective ways to capture CO₂ and store it safely is crucial. Create methods to extract CO₂ from the air and separate it into its constituent elements, carbon and oxygen, and explore how these elements can be repurposed effectively.

4. Net Zero X <All Electric Airplane>

The objective of this project is to develop a strategy for reducing CO₂ emissions from airplanes. It involves researching the current challenges faced by the airline industry regarding CO₂ emissions and conceptualizing an all-electric airplane as a viable solution to significantly lower these emissions.

5. Radioactive <Science Communication on High-Level Radioactive Waste>

High-level radioactive waste (HLW) is created by the reprocessing of spent nuclear fuel. Storage cannot provide the permanent isolation of the wastes from human's environment. This workshop aims to reveal the current conditions and possible disposal methods of HLW, and understand ways of dealing with real social issues.

6. Monster Track <Damages on Infrastructures by Oversized Vehicles>

The oversized loading induced an excessive external load which exceeds load-carrying capacity of bridges, resulted in collapse incidents. Clarify the common challenges in protection of infrastructures during their life cycle from oversized vehicles and come up with initiatives and solutions to this issue.

Around six students formed groups and challenged one of the above six problems in seven 3-hour workshops: ideation, interim report, prototyping, final report, and a reflection essay at the end. Each student is requested to create an individual reflection essay including the following descriptions.

- Project description (300-400 words)

Title, goal and conclusion of the project

Process of the project: how you applied design thinking methods

- Contribution (300-400 words)

Your role in the project

Your contribution to the project

- Reflection (200-300 words)

Write freely but we are interested in what you learned from the series of workshops not only professional knowledge and skills but also how to contribute to and facilitate the workshops

Here is a student essay to be evaluated.

[STUDENT ESSAY]

I was in the Monster group for this course, SHIP Research Planning and Skill A. Monster truck refer to oversized vehicles that have excessive weight and height. Our group focused on how these vehicles damage the infrastructure. I learned that over-weight vehicles can affect both bridges and roads. For instance, cracks at the structure of the bottom part of the bridge can be caused when an overweight vehicle repeatedly drives over. After studying the accidents caused by the Monster trucks and the current countermeasures for them, we decided that our goal was to generate solutions that would help maintain safe and secure infrastructure while having these types of vehicles.

I started thinking about my solutions by researching current solutions that are available. When researching I did not specify a region or a country as I wanted to collect different kinds of solutions. Also, because different regions will have varying environments with different traffic standards, I assumed that I could encounter solutions that I would not usually see or come up with. One of the existing solutions that I found interesting was the idea of using a monitoring device only for oversized trucks. The reason I focused on this solution is that it seemed to work in almost any road environment. Studying existing solutions is effective as it allows the solution to be more feasible. The fact that it is already being used in real life indicates that this solution is more doable than those that are not.

After choosing an existing solution I combined the solution with my ideas. This was how I invented my solution, Transport ID. It was necessary to generate new ideas so that it is an improved version of the solution. The improved idea would have new features that would solve the problems of the current solution. For instance, I added a data encryption feature to the Transport ID. I thought that this feature is necessary to prevent other parties such as the drivers from falsely inputting the data and cheat their way into unpermitted roads.

The Monster Truck group was divided into three subgroups each in charge of one solution so that we would have three solutions in total. I was in the Transport ID group as I was very involved in generating the solution. Hence, one of my roles in the Monster Truck group was to develop Transport ID as one of the solutions for our goal to maintain a safe and secure infrastructure. As the inventor of the Transport ID, I came up with its design. When creating the design diagram for the Transport ID I made sure that it was easy to understand. I avoided adding too many details to avoid confusion but enough information to show what the ID could do. In addition, I generated features that would solve the problem of current solutions, and finally, I considered and proposed the feasibility of this invention.

I also contributed to the group by asking questions to other group members. By asking questions and commenting on some of the details, I feel that they were able to reflect on their solution that they generated. I was able to go through the same process. When I was asked questions, I would add more details to the presentation so that it was more easily understood. In addition, I would also speak to the other groups about our group. I would often briefly talk about the solutions that we generated and the improvements we realized that we need to make the solutions more effective and feasible. This allowed me to summarize the things we have done that day so that we can acknowledge the progress of our project.

One of the important things I learned while participating in this workshop is the importance of asking questions to my group members and to other groups in the workshop. When I was asked a question by other people I noticed some aspects that need to be improved which I would have not noticed if they did not ask about it. When they pointed out these aspects, I was able to make improvements on it so that my solution became more efficient and feasible. Not only the questions but I learned that comments from other people during a workshop are helpful. The comments were often new ideas that could be added to the solutions I generated. More comments meant that more features were added to the inventions and they would solve more issues related to the pre-existing solutions.

Another procedure I realized was important was frequently having short meetings while working on

the presentation. Often times, I would have a meeting with the group members in the very beginning to divide the work. After working on the presentation, we would have our second and final meeting to make sure that all parts of the project are complete. Nonetheless, I noticed that having frequent meetings, more than twice is more helpful. During this project, I received more comments that significantly made my solution more effective and feasible due to the more frequent meetings we had.
[END of ESSAY]

Please do the followings:

1. First, define a rubric that will serve as the evaluation criteria.
2. Explain the existing theory behind determining the above rubric.
3. Use the rubric to evaluate the student's reflection essay above on a scale of 30 points.
4. Explain the reason why you gave the above points.

Evaluation Rubric for Student Reflection Essay

1. Content and Clarity (10 Points)

- Comprehensive Project Description (4 Points): Clear articulation of the project's title, goals, process, and conclusions.
- Detailed Contribution (3 Points): Explicit detailing of the student's role and contributions to the project.
- Insightful Reflection (3 Points): Depth and insight in reflecting on personal learning and contribution to workshop facilitation.

2. Creativity and Critical Thinking (10 Points)

- Innovation in Problem Solving (5 Points): Evidence of original and creative thinking in developing solutions.
- Critical Analysis (5 Points): Critical evaluation of existing solutions and thoughtful integration of new ideas.

3. Collaboration and Communication (10 Points)

- Team Interaction (5 Points): Active involvement in group discussions, providing and receiving feedback.
- Effective Communication (5 Points): Clarity in expressing ideas and engaging in meaningful discussions with peers.

Theoretical Basis for Rubric

The rubric is grounded in educational theories that emphasize:

- Bloom's Taxonomy: For assessing cognitive skills in comprehension, application, analysis, synthesis, and evaluation.
- Constructivist Learning Theory: Focusing on the student's active involvement in the learning process, facilitating understanding through hands-on experiences and reflection.
- Social Learning Theory: Highlighting the importance of group interactions and peer learning in the development of skills and knowledge.

Evaluation of Student's Reflection Essay

1. Content and Clarity (6/10)

- Project Description: Adequate but lacks depth in explaining the process and conclusions (2/4).
- Detailed Contribution: Clearly outlines the student's role and contributions (3/3).
- Insightful Reflection: Reflection shows some depth but could be more detailed about personal learning (1/3).

2. Creativity and Critical Thinking (7/10)

- Innovation in Problem Solving: Demonstrates creativity, especially in developing the 'Transport ID' (4/5).
- Critical Analysis: Good analysis of existing solutions, but could include more critical evaluation of their limitations (3/5).

3. Collaboration and Communication (6/10)

- Team Interaction: Shows involvement in group activities and feedback exchange (3/5).
- Effective Communication: Communication is clear but could be more engaging and persuasive (3/5).

Total Score: 19/30

Explanation for the Assigned Score

- Content and Clarity: The essay provides a clear project description and contribution but lacks depth in reflecting on personal learning and the overall process.
- Creativity and Critical Thinking: The student shows creativity in solution development and a good understanding of existing solutions, though deeper critical analysis could enhance the reflection.
- Collaboration and Communication: Active participation in the group is evident, but the essay could demonstrate more effective communication strategies and deeper engagement with team members.

Overall, the essay demonstrates good understanding and contribution to the project, with areas for improvement in depth of reflection, critical analysis, and communication.
